The plan

- Introduction
- Example: the unitary case
- The TL algebras
- The TL lattice models
- More examples

Defects - open case

$$\tilde{\phi}(x) \equiv \phi(x)$$

$$\tilde{\phi}(y) \equiv \psi(x)$$

- What's \tilde{Z} or \tilde{S} ?
- What's $\langle \tilde{\phi}(x)\tilde{\phi}(y) \rangle$?

Defects - open case

$$\tilde{\phi}(x) \equiv \phi(x)$$

$$\tilde{\phi}(y) \equiv \psi(x)$$

$$\tilde{\phi}_n(x) \equiv \phi_n(x)$$

$$\tilde{\phi}_n(y) \equiv \psi_n(x)$$

Defects - open case

$$\tilde{\phi}_n(x) \equiv \phi_n(x)$$

$$\tilde{\phi}_n(y) \equiv \psi_n(x)$$

- Not all continuous maps are allowed.
- Width of strips is not free.
- The continuous limit of Z_n is invariant under deformations.

Defects - open case

$$\tilde{\phi}_n(x) \equiv \phi_n(x)$$

$$\tilde{\phi}_n(y) \equiv \psi_n(x)$$

- Not all continuous maps are allowed.
- Width of strips is not free.
- The continuous limit of Z_n is invariant under deformations.
- Equivalent to choosing boundary conditions!

The defects - the closed case

Cross Channel

Direct Channel

Product of defects

$$D_1 \circ D_2(Z) = \sum_k \lambda_k D_k(Z)$$

Product of defects

$$D_1 \circ D_2(Z) = \sum_k \lambda_k D_k(Z)$$

Unitary, rational CFTs: $D_i \leftrightarrow$ Prim. fields, product \rightarrow faithful rep of fusion ring.

Example I: The A_p RSOS models

Includes Ising ($p = 3$), tri-critical Ising ($p = 4$), 3-states Potts ($p = 5$), etc.

Heights $1, 2, \dots, p$, $q \equiv e^{i\frac{\pi}{p+1}}$

$$\begin{array}{c}
 d - c \\
 | \quad | \\
 a - b
 \end{array}
 = \frac{qx^{-1} - q^{-1}x}{q - q^{-1}} \delta_{a,c} + \frac{x - x^{-1}}{q - q^{-1}} \delta_{b,d}$$

$$Z_{n,m} = \text{Tr}(T_n)^m$$

$$\langle a_1, \dots, a_6 | T_n | b_1, b_2, \dots, b_6 \rangle =
 \begin{array}{cccccc}
 b_1 & - & b_2 & - & b_3 & - & b_4 & - & b_5 & - & b_6 \\
 | & & | & & | & & | & & | & & | \\
 a_1 & - & a_2 & - & a_3 & - & a_4 & - & a_5 & - & a_6
 \end{array}$$

Example I: The A_p RSOS models

The width $k = 0, 1, 2, \dots, p - 2$

$$\begin{array}{c} d \text{ --- } c \\ | \quad | \\ a \text{ --- } b \end{array} = \lim_{x \rightarrow 0} \sum_{\substack{f_1, \dots, f_k \\ g_1, \dots, g_k}} \lambda_{f_1, \dots, f_k}^{g_1, \dots, g_k}(a, b, c, d)$$

$$\begin{array}{c} d \text{ --- } g_1 \text{ --- } g_2 \text{ --- } \dots \text{ --- } g_r \text{ --- } c \\ | \quad | \quad | \quad | \quad | \quad | \\ a \text{ --- } f_1 \text{ --- } f_2 \text{ --- } \dots \text{ --- } f_r \text{ --- } b \end{array}$$

$$\tilde{Z}_{n,m}(k) = \text{Tr}(\tilde{T}_n(k))^m$$

The functions $\lambda_{f_1, \dots, f_k}^{g_1, \dots, g_k}(a, b, c, d)$ are implicitly given as products of components of the eigenvectors of some matrix.

Example I: The A_p RSOS models

The width $k = 0, 1, 2, \dots, p - 2$

$$\begin{array}{c} d \\ \text{---} \\ a \end{array} \begin{array}{c} c \\ \text{---} \\ b \end{array} = \lim_{x \rightarrow \infty} \sum_{\substack{f_1, \dots, f_k \\ g_1, \dots, g_k}} \lambda_{f_1, \dots, f_k}(a, b, c, d)$$

$$\begin{array}{c} d \text{---} g_1 \text{---} g_2 \text{---} \dots \text{---} g_r \text{---} c \\ | \quad | \quad | \quad | \quad | \\ a \text{---} f_1 \text{---} f_2 \text{---} \dots \text{---} f_r \text{---} b \end{array}$$

$$\tilde{Z}_{n,m}(k) = \text{Tr}(\tilde{T}_n(k))^m$$

The functions $\lambda_{f_1, \dots, f_k}(a, b, c, d)$ are implicitly given as products of components of the eigenvectors of some matrix.

Example I: The A_p RSOS models

Continuum limit: Virasoro minimal model $M(p+1, p)$

$$H \sim \bigoplus_{s=1}^p \bigoplus_{r=1}^{p-1} (\phi_{r,s} \otimes \bar{\phi}_{r,s}) \quad (1)$$

Example I: The A_p RSOS models

Continuum limit: Virasoro minimal model $M(p+1, p)$

$$H \sim \bigoplus_{s=1}^p \bigoplus_{r=1}^{p-1} (\phi_{r,s} \otimes \bar{\phi}_{r,s}) \quad (1)$$

$$\tilde{H}(k) \sim \bigoplus_{s=1}^p \bigoplus_{r=1}^{p-1} (\overbrace{(\phi_{r,s} \times_f \phi_{1,k+1})}^{\text{Virasoro fusion!}} \otimes \bar{\phi}_{r,s}).$$

- Defects give the twisted-boundary RSOS models.
- Computing products require extensive numerics.
- What's the meaning of the λ s? How to generalize to other models?

The Temperley-Lieb algebras

Affine n -diagrams:

$$\text{Crossing} \equiv (-q)^{1/2} \text{Two Arcs} + (-q)^{-1/2} \text{Two Arcs}$$

$$\text{Circle} \equiv (q + q^{-1}) \text{Empty Circle}$$

The Temperley-Lieb algebras

Type A or *regular*

$$i = 1, 2, \dots, n-1$$

$$e_i = \underbrace{\begin{array}{c} \vdots \\ | \\ \cdots \\ | \end{array}}_{i-1} \cup \underbrace{\begin{array}{c} \vdots \\ | \\ \cdots \\ | \end{array}}_{n-i-1}$$

$$e_i e_i = (q + q^{-1}) e_i,$$

$$e_i e_{i\pm 1} e_i = e_i,$$

$$e_i e_j = e_j e_i \text{ if } |i - j| \geq 2$$

Type B or *affine*

$$b = (-q)^{-3/2} \underbrace{\begin{array}{c} \vdots \\ | \\ \text{---} \\ | \\ \vdots \end{array}}_{n-1}$$

$$e_1 b e_1 = \overbrace{(qb + q^{-1} b^{-1})}^{-Y} e_1,$$

$$e_i b = b e_i \quad i \neq 1$$

Two *Hoop* operators:

$$Y = \underbrace{\begin{array}{c} \vdots \\ | \\ \text{---} \\ | \\ \vdots \end{array}}_{n-1}$$

$$\bar{Y} = \underbrace{\begin{array}{c} \vdots \\ | \\ \text{---} \\ | \\ \vdots \end{array}}_{n-1}$$

The TL Tower structure

$$\phi^o : \mathfrak{aTL}_n \otimes_{\mathbb{C}} \mathfrak{TL}_m \rightarrow \mathfrak{aTL}_{n+m}$$

$$\phi^u : \mathfrak{aTL}_n \otimes_{\mathbb{C}} \mathfrak{TL}_m \rightarrow \mathfrak{aTL}_{n+m}$$

The TL Tower structure

$$\phi^o : \mathfrak{aTL}_n \otimes_{\mathbb{C}} \mathfrak{TL}_m \rightarrow \mathfrak{aTL}_{n+m}$$

$$\phi^u : \mathfrak{aTL}_n \otimes_{\mathbb{C}} \mathfrak{TL}_m \rightarrow \mathfrak{aTL}_{n+m}$$

For any $V \in \text{mod}(\mathfrak{TL}_m)$, $\mathfrak{aTL}_{n+m} \otimes_{\mathfrak{TL}_m} V$ is a $(\mathfrak{aTL}_{n+m}, \mathfrak{aTL}_n)$ -bimodule

TL fusions

$$M_n \equiv \text{mod}(\mathfrak{aTL}_n), \quad V \in \text{mod}(\text{TL}_m)$$

$$- \times_f^{u/o} V$$

$$M_{n-1} \subset M_n \subset M_{n+1} \subset \cdots \subset M_{n+m-1} \subset M_{n+m} \subset M_{n+m+1} \subset \cdots$$

$$- \div_f^{u/o} V$$

$$M \times_f^{u/o} V \equiv (\mathfrak{aTL}_{n+m} \otimes_{\text{TL}_m} V) \otimes_{\mathfrak{aTL}_n} M, \quad \text{Fusion product}$$

$$\bar{M} \div_f^{u/o} V \equiv \text{Hom}_{\mathfrak{aTL}_{n+m}} (\mathfrak{aTL}_{n+m} \otimes_{\text{TL}_m} V, \bar{M}), \quad \text{Fusion quotient}$$

The TL Transfer matrix

$$T_n(x) = \boxed{\begin{array}{|c|c|c|c|c|c|c|} \hline x & x & x & \cdots & x & x & x \\ \hline \end{array}},$$

$$\begin{array}{|c|} \hline \diamond x \\ \hline \end{array} = (-q)^{-1/2} x \begin{array}{|c|} \hline \times \\ \hline \end{array} - (-q)^{1/2} x^{-1} \begin{array}{|c|} \hline \times \\ \hline \end{array}.$$

The TL Transfer matrix

$$T_n(x) = \boxed{\begin{array}{ccccccc} x & x & x & \cdots & x & x & x \end{array}},$$

$$\text{Diamond}(x) = (-q)^{-1/2} x \text{X} - (-q)^{1/2} x^{-1} \text{X}.$$

$$\text{Diamond}(x, k) = (-q)^{-1/2} x \text{X}(k) - (-q)^{1/2} x^{-1} \text{X}(k).$$

The box \boxed{k} is the Jones-Wenzl projector: unique $\rho_k \in \text{TL}_k$ s.t. $\rho_k^2 = \rho_k$ and $e_i \rho_k = 0$ for all $i = 1, \dots, k-1$. Only exists for $k = 1, \dots, p-1$ ($q = e^{i\pi/(p+1)}$).

The Hamiltonian

Classical: $H_n = \sum_{i=1}^n e_i$

$$e_i = \underbrace{\begin{array}{c} | \cdots | \\ | \cdots | \end{array}}_{i-1} \cup \underbrace{\begin{array}{c} | \cdots | \\ | \cdots | \end{array}}_{n-i-1}$$

$$e_n = \underbrace{\begin{array}{c} \cup \cdots \cup \\ \cup \cdots \cup \end{array}}_n$$

With a defect $\tilde{H}_n^k = \sum_{i=1}^{n-1} \tilde{e}_i$,

$$e_i = \underbrace{\begin{array}{c} | \cdots | \\ | \cdots | \end{array}}_{i-1} \cup \underbrace{\begin{array}{c} | \cdots | \\ | \cdots | \end{array}}_{n-i-1} \boxed{k}$$

$$e_n = \underbrace{\begin{array}{c} \cup \cdots \cup \\ \cup \cdots \cup \end{array}}_n \boxed{k}$$

The theorem

For $M \in \text{mod}(\text{aTL}_{n+m})$, let $\tilde{M} \equiv \phi^u(\mathbf{1}_{\text{aTL}_n} \otimes \rho_k)M$, then

$$\begin{aligned} \tilde{H}_n^k |_{\tilde{M}} &\sim H_n |_{M \div_f^u \text{TL}_k \rho_k} & \text{or} & & H_n |_{M \div_f^o \text{TL}_k \rho_k} \\ \tilde{T}_n^k |_{\tilde{M}} &\sim T_n |_{M \div_f^u \text{TL}_k \rho_k} & \text{or} & & T_n |_{M \div_f^o \text{TL}_k \rho_k}. \end{aligned}$$

In particular,

$$\tilde{Z}_n^k |_{\tilde{M}} = Z_n |_{M \div_f^u \text{TL}_k \rho_k} \text{ or } Z_n |_{M \div_f^o \text{TL}_k \rho_k},$$

i.e. if M describe some model, $M \div_f^{u/o} V$ describes the same model with a V -defect.

Pros and cons

Pros

- Reps can be arranged in families $A[n]$, $B[n]$, etc. which describes the regulariz. of the same sector of the CFT.

$$A[n + m] \div_f^{u/o} B[m] \simeq A[n + k] \div_f^{u/o} B[k],$$

- Products of defects are easy

$$(A \div_f^u B) \div_f^u C \simeq A \div_f^u \underbrace{(B \otimes C)}_{\text{Tensor prod. of the TL cat.}} .$$

Pros and cons

Pros

- Reps can be arranged in families $A[n]$, $B[n]$, etc. which describes the regulariz. of the same sector of the CFT.

$$A[n + m] \div_f^{u/o} B[m] \simeq A[n + k] \div_f^{u/o} B[k],$$

- Products of defects are easy

$$(A \div_f^u B) \div_f^u C \simeq A \div_f^u \underbrace{(B \otimes C)}_{\text{Tensor prod. of the TL cat.}} .$$

Cons

- Any info. that is basis dependent is lost.
- Computing the iso-class of a fusion quotient is (relatively) easy, finding what it is is difficult.

Example I: Twisted RSOS on A_p

$$\begin{array}{ccc}
 & \text{Closed} & \\
 Y = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \text{---} | \text{---} | \text{---} | \text{---} | \\ \vdots \vdots \vdots \vdots \vdots \end{array}} & \bar{Y} = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \text{---} | \text{---} | \text{---} | \text{---} | \\ \vdots \vdots \vdots \vdots \vdots \end{array}} & F = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \text{---} | \text{---} | \text{---} | \text{---} | \\ \vdots \vdots \vdots \vdots \vdots \end{array}} \\
 q^x + q^{-x} & q^y + q^{-y} & q^z + q^{-z}
 \end{array}$$

The diagram shows three Temperley-Lieb configurations. The first two, labeled 'Closed', are Y and \bar{Y} . Y consists of four vertical strands with two horizontal crossings between the first and second strands, and two between the third and fourth strands. \bar{Y} consists of four vertical strands with two horizontal crossings between the second and third strands, and two between the first and second strands. The third configuration, labeled 'Open', is F , which consists of four vertical strands with two horizontal crossings between the first and second strands, and two between the second and third strands, with a curved strand connecting the second and third strands from the bottom.

Example I: Twisted RSOS on A_p

$$\begin{array}{ccc}
 \overbrace{\qquad\qquad\qquad}^{\text{Closed}} & & \overbrace{\qquad\qquad\qquad}^{\text{Open}} \\
 Y = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \vdots | \vdots | \vdots | \vdots | \\ \vdots \vdots \vdots \vdots \vdots \end{array}}_{q^x + q^{-x}} & \bar{Y} = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \vdots | \vdots | \vdots | \vdots | \\ \vdots \vdots \vdots \vdots \vdots \end{array}}_{q^y + q^{-y}} & F = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \vdots | \vdots | \vdots | \vdots | \\ \vdots \vdots \vdots \vdots \vdots \end{array}}_{q^z + q^{-z}}
 \end{array}$$

$$(x, y) \div_f^o(z) \simeq \sum_{\substack{k=|x-z|+1 \\ \text{step}=2}}^{\min(x+z-1, 2(p+1)-(x+z)-1)} (k, y),$$

$$(x, y) \div_f^u(z) \simeq \sum_{\substack{k=|y-z|+1 \\ \text{step}=2}}^{\min(y+z-1, 2(p+1)-(y+z)-1)} (x, k),$$

$$((1, 1) \div_f^o(x)) \div_f^u(y) \simeq (x, y).$$

Example I: Twisted RSOS on A_p

$$\begin{array}{ccc}
 \text{Closed} & & \text{Open} \\
 \overbrace{Y = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \text{---} | \text{---} | \text{---} | \text{---} | \\ \vdots \vdots \vdots \vdots \vdots \end{array}}_{q^x + q^{-x}}} & \bar{Y} = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \text{---} | \text{---} | \text{---} | \text{---} | \\ \vdots \vdots \vdots \vdots \vdots \end{array}}_{q^y + q^{-y}} & F = \underbrace{\begin{array}{c} \vdots \vdots \vdots \vdots \vdots \\ | \text{---} | \text{---} | \text{---} | \text{---} | \\ \vdots \vdots \vdots \vdots \vdots \end{array}}_{q^z + q^{-z}}
 \end{array}$$

Non-unitary simple reps:

$$\text{Closed: } \left(\underbrace{\xi}_{\in \mathbb{C}} ; \underbrace{\alpha}_{\in \mathbb{Z}} \right), \quad \text{Open: } \left(\underbrace{z}_{\in \mathbb{Z}_{\geq 1}} \right).$$

$$\underbrace{(q^x + q^{-x}; x - y)}_{\text{RSOS rep.}} \div_f^u(z) \simeq 0 \quad \text{unless } z \leq p.$$

Example II: The XXZ spin-chain

The Hilbert space is $\mathbb{C}_2^{\otimes n}$ and

$$H_n(Q) = \sum_{j=1}^n \left(\sigma_j^- \sigma_{j+1}^+ + \sigma_{j+1}^- \sigma_j^+ + \frac{q + q^{-1}}{4} (\sigma_j^z \sigma_{j+1}^z - 1) \right),$$

$$\sigma_{n+1}^z \equiv \sigma_1^z, \quad \sigma_{n+1}^\pm \equiv Q^{\mp 2} \sigma_1^\pm.$$

$$Y = (-1)^n (q^{S_z} Q^{-1} + q^{-S_z} Q), \quad \bar{Y} = q^{S_z} Q + q^{-S_z} Q^{-1},$$

Example II: The XXZ spin-chain

$$\begin{aligned}
 H_{n-1}^u(Q) &= \sum_j^{n-1} (a_j^- a_{j+1}^+ + a_{j+1}^- a_j^+ + \frac{q + q^{-1}}{4} (a_j^z a_{j+1}^z - 1)) \\
 &\quad + \left((1 - q^{2a_1^z}) a_{n-1}^- + Q^2 (1 - q^{-2a_{n-1}^z}) a_1^- \right) \sigma_n^+, \\
 &\quad \begin{matrix} (\dots) \otimes |\uparrow\rangle & (\dots) \otimes |\downarrow\rangle \\ H_{n-1}(-Qq^{-1/2}) & \Delta \\ 0 & H_{n-1}(-Qq^{1/2}) \end{matrix} \\
 &\sim \begin{pmatrix} H_{n-1}(-Qq^{-1/2}) & \Delta \\ 0 & H_{n-1}(-Qq^{1/2}) \end{pmatrix}, \\
 \Delta &= (1 - q^{2a_1^z}) a_{n-1}^- + Q^2 (1 - q^{-2a_{n-1}^z}) a_1^-
 \end{aligned}$$

where $a_j^k = \sigma_j^k$, $k = z, \pm$, $j = 1, 2, \dots, n-1$, and

$$a_n^z \equiv a_1^z, \quad a_n^\pm \equiv (Q^2 q^{-\sigma_n^z})^{\mp 1} a_1^\pm. \quad (2)$$

Example II: The XXZ spin-chain

$$Y = (-1)^n (q^{S_z} Q^{-1} + q^{-S_z} Q),$$

$$\bar{Y} \sim \begin{pmatrix} (\dots) \otimes |\uparrow\rangle & (\dots) \otimes |\downarrow\rangle \\ Q_- q^{\tilde{S}_z} + Q_-^{-1} q^{-\tilde{S}_z} & Q(q - q^{-1})^2 \tilde{S}_- \\ 0 & Q_+ q^{\tilde{S}_z} + Q_+^{-1} q^{-\tilde{S}_z} \end{pmatrix},$$

where $Q_{\pm} \equiv -Qq^{\pm 1/2}$, and \tilde{S}_- , $q^{\pm \tilde{S}_z}$ are the standard $U_q(\mathfrak{sl}_2)$ generators on $n - 1$ spins.

Example III: The XX spin chain

Let f_i, f_i^+ , $i = 1, 2, \dots$ be a family of fermion operators, i.e.

$$\{f_i, f_j^+\} = \delta_{i,j}, \quad \{f_i, f_j\} = \{f_i^+, f_j^+\} = 0.$$

The twisted XX spin chain is defined by the Hamiltonian

$$H_n = \sum_{j=1}^n -i(g_j + ig_{j+1})(g_j^+ + ig_{j+1}^+), \quad (2)$$

where $g_j \equiv f_j$ for all $j = 1, \dots, n$ and boundary conditions:

$$\begin{array}{ll} g_{n+1} \equiv e^{i\theta} g_1, & g_{n+1}^+ \equiv e^{-i\theta} g_1^+ & \text{(Classical)} \\ g_{n+1} \equiv e^{i\theta} g_1 + 2ig_{n+1}, & g_{n+1}^+ \equiv e^{-i\theta} g_1^+ & \text{(Spin-1/2 u-defect)} \\ g_{n+1} \equiv e^{i\theta} g_1, & g_{n+1}^+ \equiv e^{-i\theta} g_1^+ + 2ig_{n+1}^+ & \text{(Spin-1/2 o-defect)} \\ g_{n+1} \equiv e^{i\theta} g_1 - 2ig_{n+2}, & g_{n+1}^+ \equiv e^{-i\theta} g_1^+ + 2ig_{n+1}^+ & \text{(Double Spin-1/2 defect)} \end{array}$$

Example III: The XX spin chain

$$\begin{array}{ll}
 g_{n+1} \equiv e^{i\theta} g_1, & g_{n+1}^+ \equiv e^{-i\theta} g_1^+ & \text{(Classical)} \\
 g_{n+1} \equiv e^{i\theta} g_1 + 2ig_{n+1}, & g_{n+1}^+ \equiv e^{-i\theta} g_1^+ & \text{(Spin-1/2 u-defect)} \\
 g_{n+1} \equiv e^{i\theta} g_1, & g_{n+1}^+ \equiv e^{-i\theta} g_1^+ + 2ig_{n+1}^+ & \text{(Spin-1/2 o-defect)} \\
 g_{n+1} \equiv e^{i\theta} g_1 - 2ig_{n+2}, & g_{n+1}^+ \equiv e^{-i\theta} g_1^+ + 2ig_{n+1}^+ & \text{(Double Spin-1/2 defect)}
 \end{array}$$

- Eigenvalues are real if and only if $\theta \in \mathbb{R}$,
- Models with defects are diagonalizable if and only if

$$\theta \neq \frac{(2m+1)}{2} \pi n \quad \text{for any } m \in \mathbb{Z}.$$

- They all have the same spectrum (with double or quadruple multiplicities with defects).

So what now?

- Modular transformations?
- Massive gap in the rep. theory of aTL at root of unity.
- Rep. theory when hoops are non-diagonal is (mostly) in-existent.
- Physical meaning of those new boundary conditions?

The end

Thank you!
