## ABO Blood Type Game

The following lesson is adapted from the Red Cross ABO Blood Type Game

Materials

| 8 | 3.5 oz cups labeled " $\mathrm{A} "$ |
| :--- | :--- |
| 8 | 3.5 oz cups labeled " $\mathrm{B} "$ |
| 8 | 3.5 oz cups labeled " AB" |
| 8 | 3.5 oz cups labeled " O" |
| 32 | pipettes |
| 1 | 250 ml bottle water plus 15 drops red food coloring, labeled "A" |
| 1 | 250 ml bottle water plus 10 drops blue food coloring, labeled "B" |
| 1 | 250 ml bottle water plus 7 drops red +5 drops blue food coloring, labeled "AB" |
| 1 | 250 ml bottle water, labeled "O" |
| 15 | 12-well plates |
| 30 | worksheets |

## Color Concentration for food coloring:

I use the ratio of 5 drops of food coloring for every 100 mL water. So a $1,000 \mathrm{ml}$ beaker or flask would have 50 drops. Set these up ahead of time. For purple do half red and half blue drops, for green I would just use the green food coloring at $5 / 100 \mathrm{~mL}$.

Blood Type A is Red (*or Blue)
Blood Type B is Blue (*or Yellow)
Blood Type AB is Purple (*or Green)
Blood Type O is Clear

## Background Information

The following information is from the Red Cross

- Almost $40 \%$ of the population has O+ blood
- Patients with Type O blood must receive Type O blood
- About half of all blood ordered by hospitals in our area is Type O
- Type O blood is the universal blood type and is the only blood type that can be transfused to patients with other blood types
- Only about 7\% of all people have Type O negative blood
- Type O negative blood is the preferred type for accident victims and babies needing exchange transfusions
- There is always a need for Type O donors because their blood may be transfused to a person of any blood type in an emergency

If your blood type is:

| Type | You Can Give Blood To | You Can Receive Blood From |
| :--- | :--- | :--- |
| A + | A + AB + | A+ A- O+ O- |
| $\mathrm{O}+$ | $\mathrm{O}+\mathrm{A}+\mathrm{B}+\mathrm{AB}+$ | $\mathrm{O}+\mathrm{O}-$ |
| $\mathrm{B}+$ | $\mathrm{B}+\mathrm{AB}+$ | B+ B- O+ O- |
| AB + | $\mathrm{AB}+$ | Everyone |
| A- | A+ A- AB + AB- | A- O- |
| O- | Everyone | O- |
| B- | B+ B- AB + AB- | B- O- |
| AB- | AB + AB- | AB- A- B- O- |

Out of 100 donors . . . . .

| 84 donors are $\mathrm{RH}+$ | 16 donors are $\mathrm{RH}-$ |
| :---: | :---: |
| 38 are $\mathrm{O}+$ | 7 are $\mathrm{O}-$ |
| 34 are $\mathrm{A}+$ | 6 are $\mathrm{A}-$ |
| 9 are $\mathrm{B}+$ | 2 are $\mathrm{B}-$ |
| 3 are $\mathrm{AB}+$ | 1 is $\mathrm{AB}-$ |

## Experiment.

## Tell students that:

- If the color of the "blood" changes, it is not compatible.
- If the "blood" color stays the same, then it is compatible.

## A. Patient \#1 is Type $A$.

Patient \#1 needs a transfusion. Ask students what blood types can this patient receive?
For patient \#1, tell students to:

1) Pipette 3 squirts of liquid from Type $A$ into the $1^{\text {st }}$ well .
2) Do a "transfusion" by adding 3 more squirts of Type A to the $1^{\text {st }}$ well and note if there is any change in color. (There is no change.)

Explain that No change $=$ Safe, Change $=$ unsafe .
3) Now pipette another 3 squirts of type A from patient \#1 into the second well on row 1
4) This time, add 3 squirts of Type B to the patient for the "tranfusion."
a. Students will notice a color change and see the change means that this is Unsafe, b.
5) Add 3 squirts of Type $A$ to wells 3 and 4 on Row 1 and add Type $A B$ and $O$ to determine if these blood types are safe for patient 1 .
B. Patient \#2 is Type B.
C. Patient \#3 is Type AB.
D. Patient \#4 is Type 0 .

Tell students to make an hypothesis as to which blood types the patients \#2, 3 and 4 could safely receive in a transfusions and then test it. Follow the same procedure as above.

Results and conclusions:

- Blood type $A$ can only be given to type $A$ and $A B$ patients.
- Blood type $B$ can only be given to type $B$ and $A B$ patients.
- Blood type AB individuals can receive blood from everyone, but they can only donate to other AB blood type patients.
- Blood type O individuals can only receive type O blood, but they can donate blood to every other type.

Adapted from the Red Cross Blood Typing game

## Blood Type Chart:

|  | Color change <br> (yes/no)? <br> $\mathbf{A}$ added | Color change <br> (yes/no)? <br> $\mathbf{B}$ added | Color change <br> (yes/no)? <br> $\mathbf{A B}$ added | Color change <br> (yes/no)? <br> $\mathbf{O}$ added |
| :---: | :---: | :---: | :---: | :---: |
| Patient \#1 <br> Type A |  |  |  |  |
| Patient \#2 <br> Type B |  |  |  |  |
| Patient \#3 <br> Type AB |  |  |  |  |
| Patient \#4 |  |  |  |  |
| Type O |  |  |  |  |

## Conclusions

Blood type A can only be given to type $\qquad$ patients.
Blood type A patients can only receive $\qquad$ type blood.

Blood type B can only be given to type $\qquad$ patients.
Blood type B patients can only receive $\qquad$ type blood

Blood type $A B$ can only be given to type $\qquad$ patients.
Blood type AB patients can only receive $\qquad$ type blood

Blood type O can only be given to type $\qquad$ patients.
Blood type O patients can only receive $\qquad$ type blood
