**Question**

*Can we walk through all seven bridges of Konigsberg exactly once?*

Each landmass is a vertex and each bridge is an edge. Notice that whenever one enters a vertex by an edge they must leave the vertex by a different edge. Therefore, each vertex (except for the starting and finishing ones) must have an even degree.

Each landmass is a vertex and each bridge is an edge. Notice that whenever one enters a vertex by an edge they must leave the vertex by a different edge. Therefore, each vertex (except for the starting and finishing ones) must have an even degree. The walk is only possible if exactly zero or two vertices have odd degree.
