

Multisensory Pre-Alarm System for Physicians

Jonathan Samuels, Julia Balas, Alex Jolly, Claire McCoy, Seema Patel
Mystery Machine

Oral Report 6
March 14, 2019

Problem Statement

- Distracting alarms and sounds in Intensive Care Units
- Leads to patient and physician fatigue
- No differentiation between different parameters

Needs Assessment

- **UX**
- Patient Efficacy
- Safety
- Hospital System Efficiency
- **Technical Needs**

Needs Assessment

- UX
- Patient Efficacy
- Safety
- Hospital System Efficiency
- Technical Needs

Needs Assessment

- UX

- P

- S

- H

- T

Audio Input

ALARM

ALARM

Discrete

- Brief pulses indicating a state change
- Convey information by length of pulse and number of pulses

Haptic Input on wrist and ankle

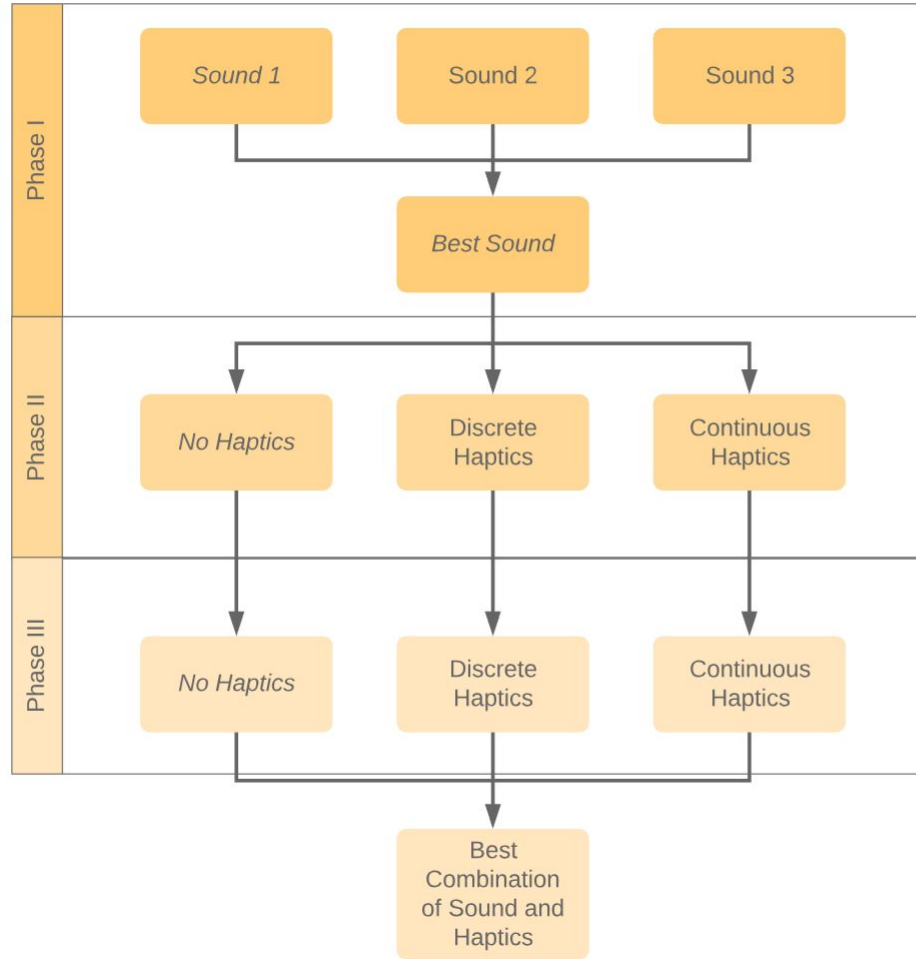

Continuous

- Sounds reduced to very low, subwoofer frequencies (20-200 Hz)
- “Feel” the change in sound

Updates

- 1) Phase III
- 2) Phase I Data Analysis
- 3) Phase II Data Analysis

Phase III of Study

Phase II Overview

Repeat for
Iterations 2
and 3

Haptics Training/Testing

2.1: Introduce Haptics

- Play training clip
- Exploration
- Quiz

2.2: Test

- Introduce block
- Give user full test

Qualitative Survey

Phase III Overview

Repeat for
Iterations 2
and 3

Haptics Training/Testing

3.1: Present Associations

- Play sounds/haptics once for each zone/vital

3.2: Test

- Introduce block
- Give user full test

Qualitative Survey

Qualitative Survey

- NASA Task Load Index (ranking from 1-7)
 - Temporal Demand
 - Mental Demand
 - Effort
 - Physical Demand
 - Performance
 - Frustration
- System Usability Scale (SUS) - Assess how easy system was to use

NASA Task Load Index

Hart and Staveland's NASA Task Load Index (TLX) method assesses work load on five 7 point scales. Increments of high, medium and low estimates for each point result in 21 gradations on the scales.

Name	Task	Date

Mental Demand How mentally demanding was the task?

Very Low Very High

Physical Demand How physically demanding was the task?

Very Low Very High

Temporal Demand How hurried or rushed was the pace of the task?

Very Low Very High

Performance How successful were you in accomplishing what you were asked to do?

Perfect Failure

Effort How hard did you have to work to accomplish your level of performance?

Very Low Very High

Frustration How insecure, discouraged, irritated, stressed, and annoyed were you?

Very Low Very High

Data Analysis: Phase I

HR

BP

SpO2

Data to be collected:

Response Time

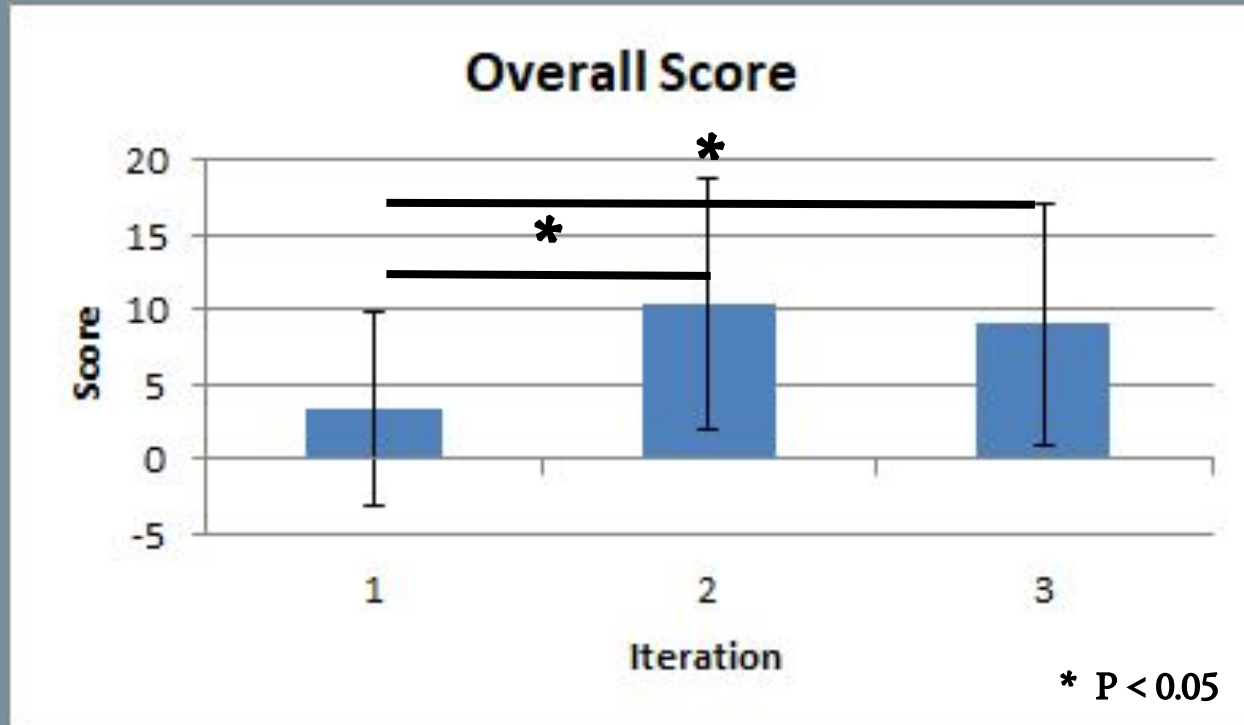

Accuracy

- Vital
- Zone
- Change detected

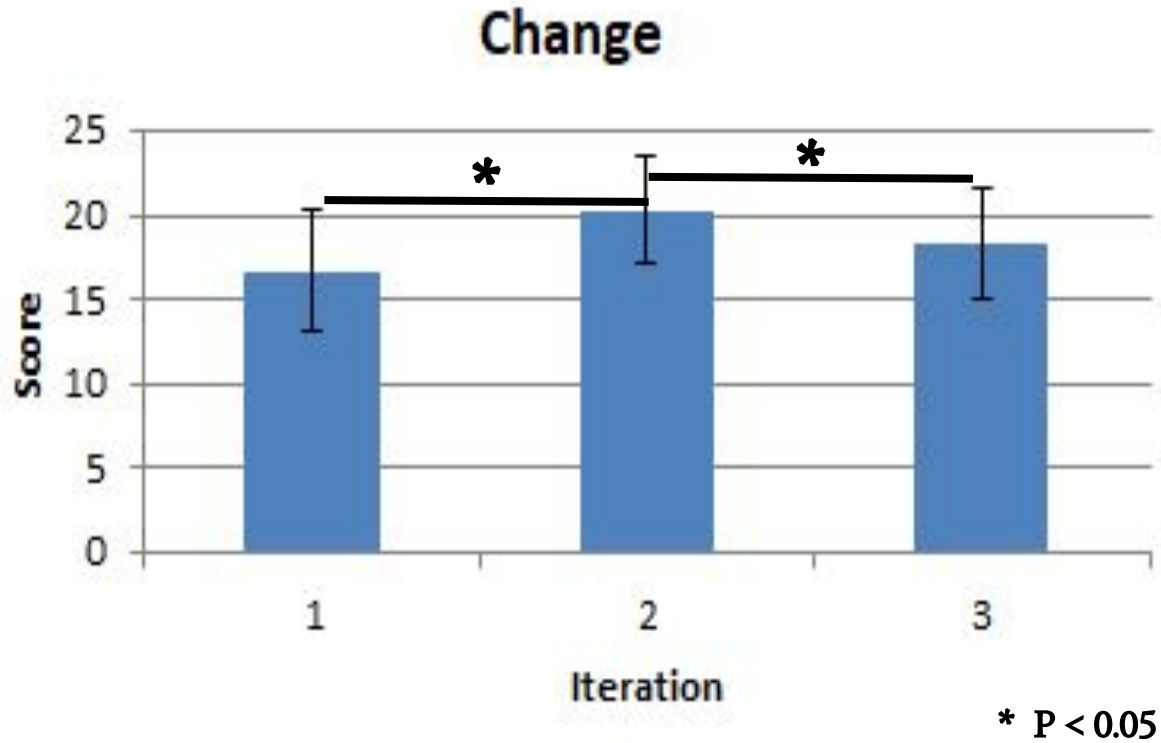

Rubric for Overall Score

What Occurred	What Subject Thought Occurred	Points
No Change	Change	-0.33
Change	No Change	-0.33
Change	Wrong Vital	-1
Change	Correct Vital	+1
	Correct Zone	+0.5
Maximum possible score = 25.5		

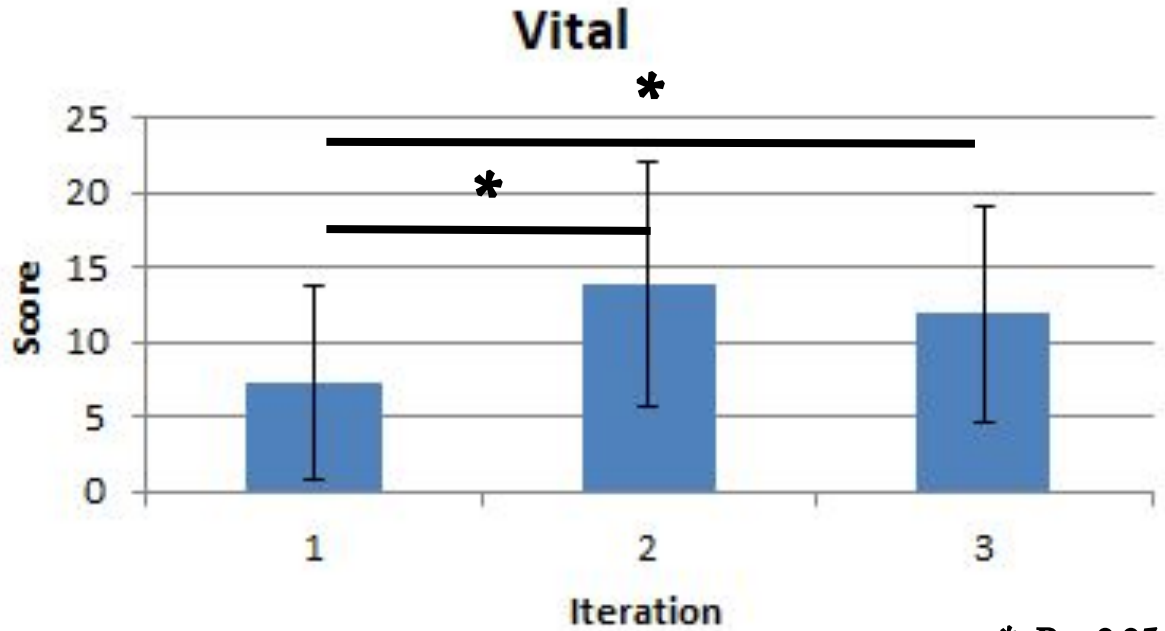

Results

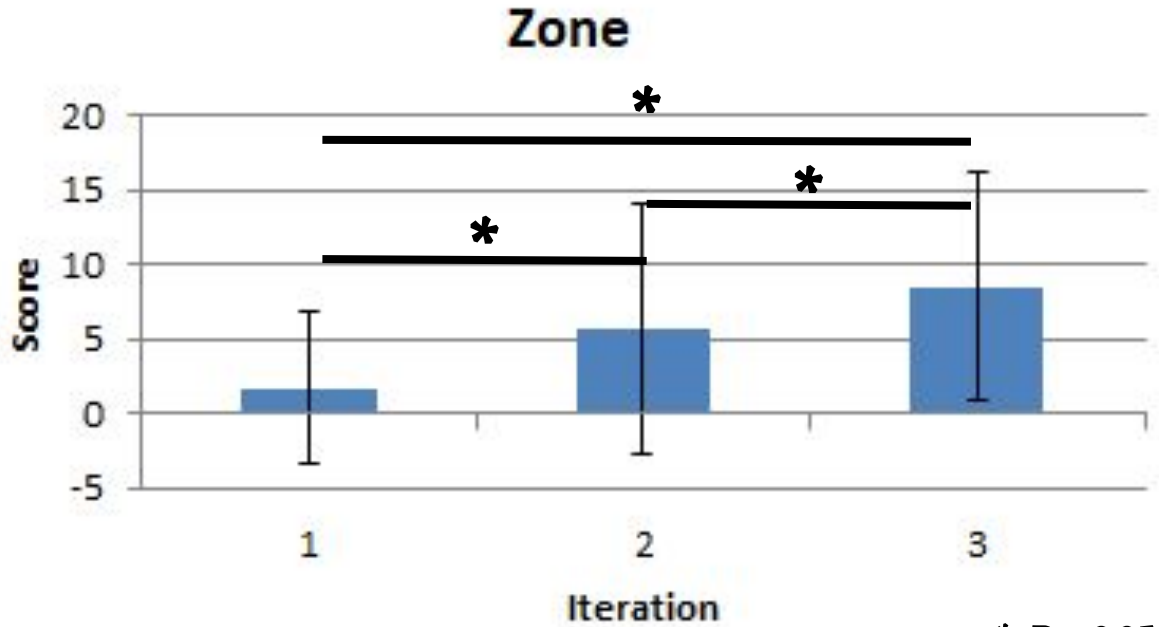

Results

Results

Results

* P < 0.05

Results

Results

- Iteration 2 was chosen for further use in Phases II and III based off of quantitative and qualitative data
 - Significantly better than Iteration 1 for all tested metrics
 - Significantly better than Iteration 3 for subjects' ability to detect a correct "change"
- Iteration 3 was significantly better for detecting the correct "zone"
 - Haptics indicate zones, but change viewed as more important

Data Analysis: Phase II

Preliminary Results: Phase II

- Preferred the use of discrete over continuous haptics thus far based on qualitative subject feedback
- Need for normalization?
- Still need to analyze NASA-TLX and SUS data to assess comparative load on user

Next Steps

- Phase II/III data analysis
 - Response time
 - Accuracy
 - Statistical tests
 - Qualitative analysis
- Analysis of training/success correlation
- Write paper
 - Rough draft due to Dr. Schlesinger week of March 18th
